

Feature & Improvement Suggestions

Automated Outbound Calling Agent Platform — based on the current system plan

1. Answering-Machine Detection (AMD)

Reliability & Cost

Distinguish a human pickup from a voicemail pickup before playing the full script. Log it as its own call outcome. Saves telephony credits and avoids blasting the pitch into someone's voicemail.

2. Two-Way IVR Interaction

Product

After the script plays, offer simple keypad options: "Press 1 to talk to a representative, Press 2 to stop receiving these calls, Press 9 to hear this again." Turns a one-way blast into a lightweight qualification funnel and doubles as a built-in opt-out mechanism.

3. Live Call Transfer / Human Handoff

Product

If a contact presses 1, forward the live call to your sales number instead of simply hanging up. Often the single highest-ROI feature for this kind of system.

4. Global Opt-Out Ledger

Compliance

Maintain a permanent opt_outs table keyed by phone number, independent of any contact list or campaign. Check it before every future call, even if the same number is re-uploaded in a new Excel file months later.

5. Campaign Dry-Run / Preview

Product

Before dialing, show the user: contacts remaining after DND scrubbing, estimated cost (contacts x avg. duration x per-minute rate), and estimated completion time given the configured concurrency limit.

6. A/B Script Testing

Product

Since scripts already support versioning, let a campaign split a contact list across two active script versions and report answer/success rates per version.

7. Call Recording + Transcript Analytics

Product

With disclosure (required under TRAI anyway), record calls and run speech-to-text to flag where people hang up or what questions the script doesn't answer. Even average call duration vs. script length is a useful signal.

8. Per-Contact Timezone-Aware Calling Windows

Reliability & Cost

Calling-hours enforcement is currently one global window (9 AM-9 PM IST). If contacts ever span regions/timezones, base the allowed window on each contact's region rather than a single global setting.

9. Idempotent Webhook Handling

Engineering

Exotel retries webhooks on failure, so call_logs updates should upsert by exotel_call_sid rather than blindly inserting, to avoid duplicate or inconsistent status rows.

10. Soft-Delete for Contacts & Scripts

Compliance

Use a deleted_at flag instead of CASCADE delete, so the required 12-month CDR retention is preserved while the UI still looks clean to the user.

11. Strict Multi-Tenant Query Scoping

Engineering

Explicitly filter every service-layer query by user_id rather than relying only on foreign keys, so it stays safe to add more users or team members later without risking cross-tenant data leaks.

12. Visible Cost Dashboard

Product

Surface live telephony spend against the remaining credit balance directly in the dashboard UI, not just as a background alert once 80% of credits are used.
